Inspection Mode

Initial Inspection

Follow-up Inspection

查核日期：民國 年 月 日

Date of Inspection：MM DD,YYYY

查核結果(不)符合經濟部標準檢驗局再生能源憑證申請及管理作業程序

Summary of Results for Units Inspection:

The operation and processes within the above-mentioned generation have shown the conformance to the requirements regulated by the BSMI.

核發日期：民國 年 月 日

授權核發

Authorized Issue

Date of Issue：

Note:

1. After completing the certified renewable energy equipment audit processes and acquiring the audit report thereof, the Applicant shall subsequently submit the following data to facilitate certificate audit and issuance:
 - (1) The power from independent direct supply and self-use renewable energy power generation starts to accrue from the date when the facility is verified as meeting the requirements,
 - (2) and the power of grid connected direct supply and wheeling starts to accrue from the date when the direct power supply and wheeling begins.
 - (3) Power generation registration
 - a. Applicants without any automatic transmission device

The Applicant shall register the monthly power generation data for the previous month and provide the electricity meter readings and certifying photographs (dated) prior to the third day of each month. The Applicant may take the reading on the final work day of each month.
 - b. Applicants with automatic data transmission device

After T-REC confirms that the automatically transmitted readings are normal, the certificate will be issued using transmitted power generation data.
 - c. Applicants that provide wheeling services through an electricity transmission and distribution enterprise

The Applicant shall submit the electricity bill notice from the power transmission and distribution enterprise and the T-REC Center shall register the power generation data each month.
2. Power generation data of the audited certified renewable energy equipment will be disclosed on the website of the National Renewable Energy Certification Center.
3. The annual estimated power generation is for reference only and may be affected by weather, environment and mechanical issues, O&M, and other factors. Power generation will ultimately be calculated based on actual results.
